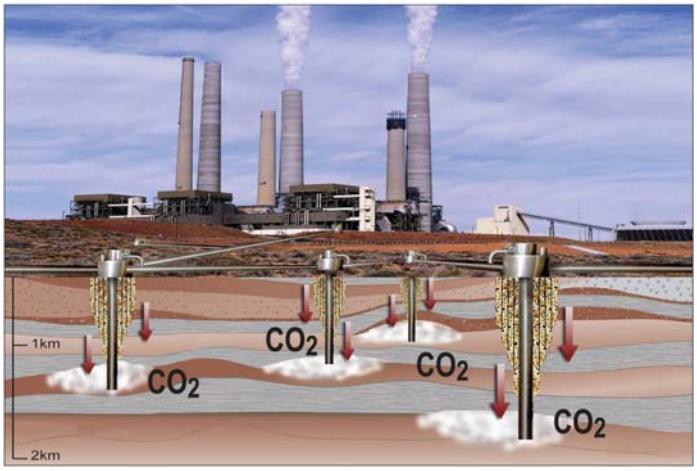
Sacramento Sheraton & University of Southern California
February 13 & 14, 2008

Carbon Dioxide Capture and Storage in Deep Geological Formations

Professor Sally M. Benson
Energy Resources Engineering Department
Executive Director, Global Climate and Energy Project
Stanford University

Science and technology for a low GHG emission world.

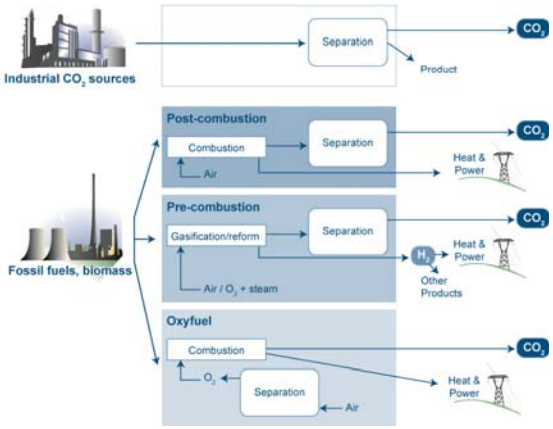
Carbon Dioxide Capture and Geologic Storage



Capture → **Compression** → **Pipeline Transport** → **Underground Injection**

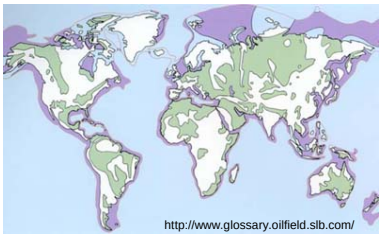
Options for CO_2 Capture

- Post-combustion
  - Established technology
- Pre-combustion
  - Established technology for other applications
  - Not demonstrated for power production
- Oxygen combustion
  - Not demonstrated for power production

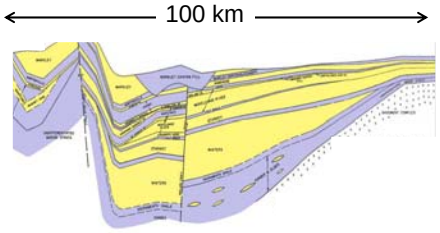


What Types of Rock Formations are Suitable for Geological Storage?

Rocks in deep sedimentary basins are suitable for CO_2 storage.



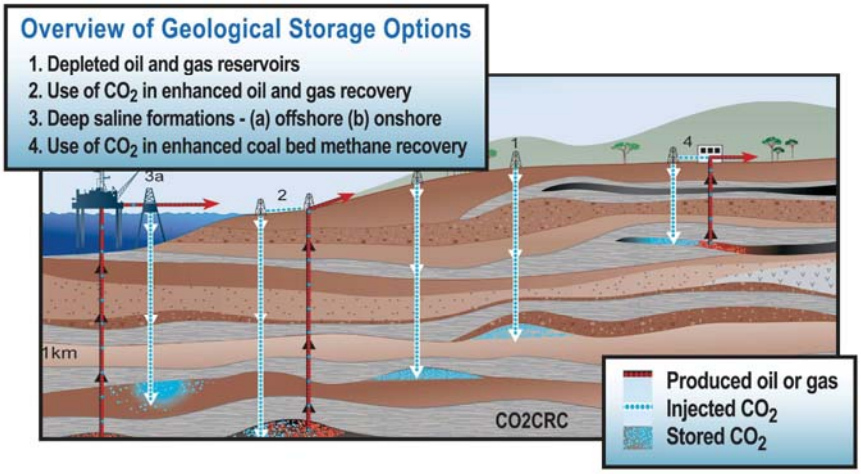
Map showing world-wide sedimentary basins



Northern California Sedimentary Basin

Example of a sedimentary basin with alternating layers of coarse and fine textured sedimentary rocks.

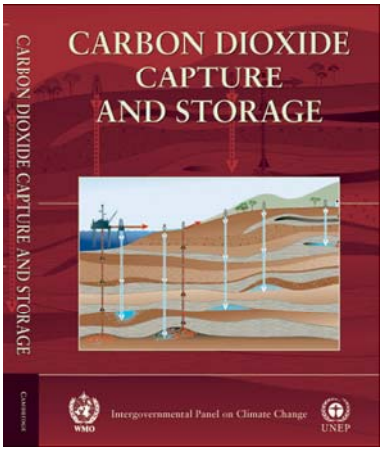
Options for Geological Storage



Expert Opinion about Storage Safety and Security

" Observations from engineered and natural analogues as well as models suggest that the fraction retained in appropriately selected and managed geological reservoirs is very likely to exceed 99% over 100 years and is likely** to exceed 99% over 1,000 years."*

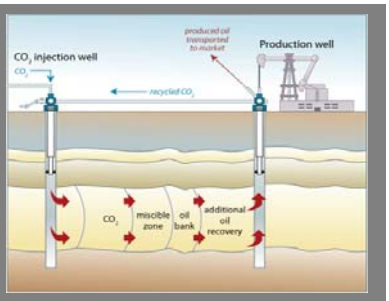
" With appropriate site selection informed by available subsurface information, a monitoring program to detect problems, a regulatory system, and the appropriate use of remediation methods to stop or control CO_2 releases if they arise, the local health, safety and environment risks of geological storage would be comparable to risks of current activities such as natural gas storage, EOR, and deep underground disposal of acid gas."

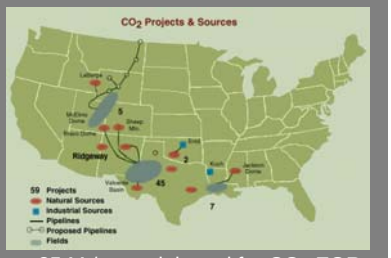


* "Very likely" is a probability between 90 and 99%.
** Likely is a probability between 66 and 90%.

Evidence to Support these Conclusions

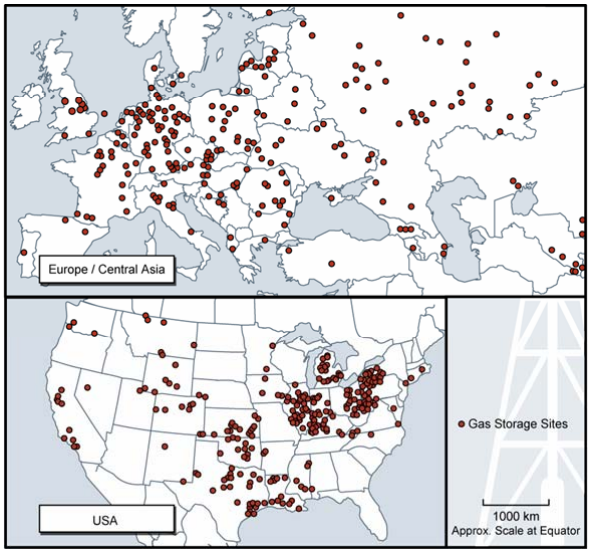
- Natural analogs
  - Oil and gas reservoirs
  - CO_2 reservoirs
- Performance of industrial analogs
  - 30+ years experience with CO_2 EOR
  - 100 years experience with natural gas storage
  - Acid gas disposal
- 20+ years of cumulative performance of actual CO_2 storage projects
  - Sleipner, off-shore Norway, 1996
  - Weyburn, Canada, 2000
  - In Salah, Algeria, 2004





~35 Mt/yr are injected for CO_2-EOR

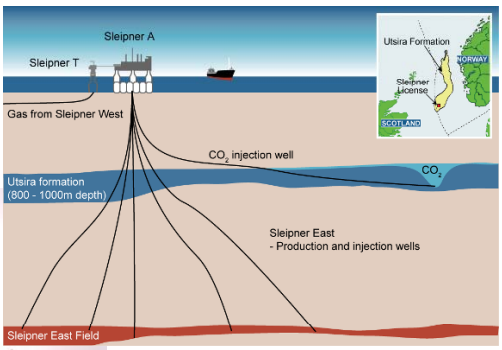
Natural Gas Storage



- Seasonal storage to meet winter loads
- Storage formations
  - Depleted oil and gas reservoirs
  - Aquifers
  - Caverns

Sleipner Project, North Sea

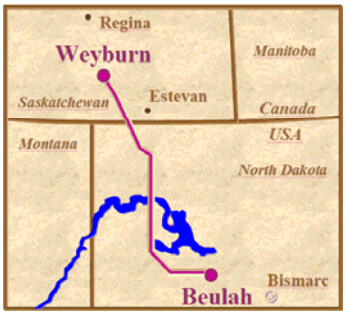
- 1996 to present
- 1 Mt CO_2 injection/yr
- Seismic monitoring



Picture compliments of *Statoil*

Weyburn CO_2-EOR and Storage Project

- 2000 to present
- 1-2 Mt/year CO_2 injection
- CO_2 from the Dakota Gasification Plant in the U.S.



In Salah Gas Project

In Salah Gas Project
- Krechba, Algeria

Gas Purification
- Amine Extraction

1 Mt/year CO_2 Injection

Operations Commence
- June, 2004

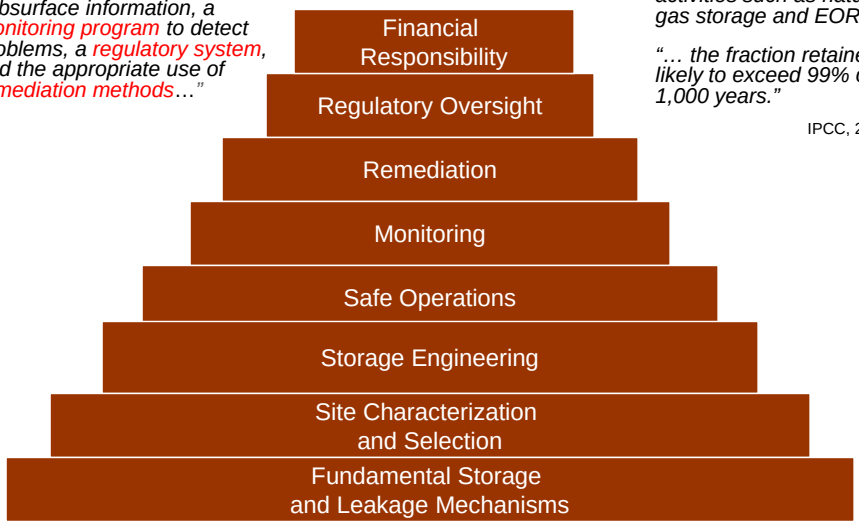
Key Elements of a Geological Storage Safety and Security Strategy

" With appropriate site selection informed by available subsurface information, a monitoring program to detect problems, a regulatory system, and the appropriate use of remediation methods…"

"… risks similar to existing activities such as natural gas storage and EOR."

"… the fraction retained is likely to exceed 99% over 1,000 years."

IPCC, 2005



Variation with Depth and Geothermal Regime of Carbon Dioxide Density

Micro-tomography Beamline

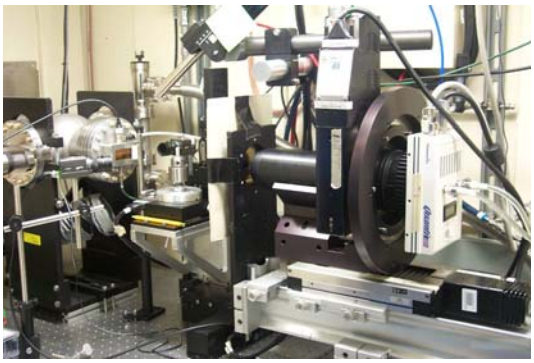

Image of Rock with CO_2

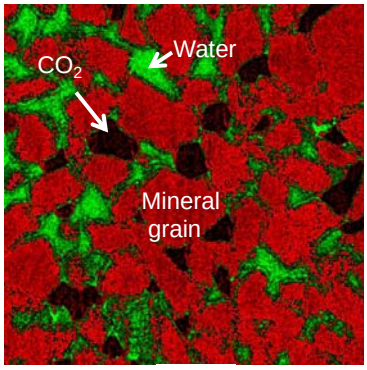

Storage Mechanisms

- Injected at depths of 1 km or deeper into rocks with tiny pore spaces
- Primary trapping
  - Beneath seals of low permeability rocks
- Secondary trapping
  - CO_2 dissolves in water
  - CO_2 is trapped by capillary forces
  - CO_2 converts to solid minerals
  - CO_2 adsorbs to coal

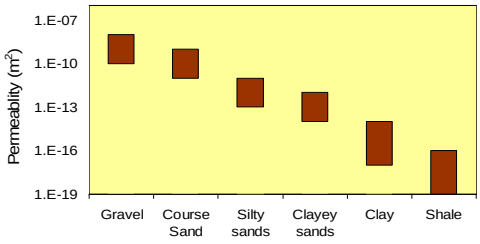
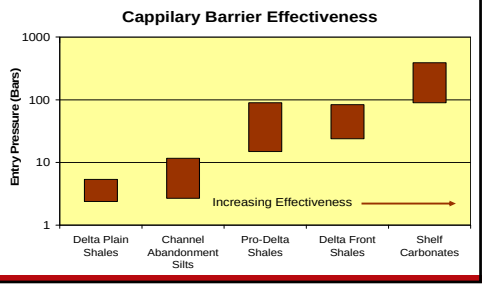
Seal Rocks and Mechanisms

- Shale, clay, and carbonates
- Permeability barriers to CO_2 migration
- Capillary barriers to CO_2 migration





Secondary Trapping Mechanisms Increase Over Time

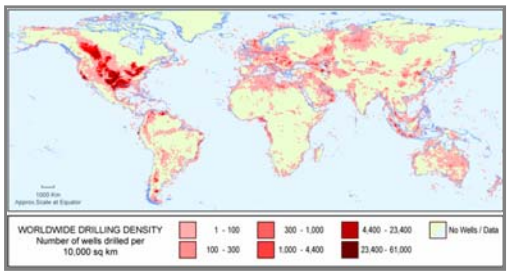
What Could Go Wrong?



Potential Release Pathways

- Well leakage (injection and abandoned wells)
- Poor site characterization (undetected faults)
- Excessive pressure buildup damages seal

Potential Consequences

1. Worker safety
2. Groundwater quality degradation
3. Resource damage
4. Ecosystem degradation
5. Public safety
6. Structural damage
7. Release to atmosphere

Risk Management

Financial Responsibility	Financial mechanisms and institutional approaches for long term stewardship (e.g. monitoring and remediation if needed)
Regulatory Oversight	Oversight for site characterization and selection, storage system operation, safety, monitoring and contingency plans
Remediation	Active and abandoned well repair, groundwater cleanup, and ecosystem restoration
Monitoring	Monitoring plume migration, pressure monitoring in the storage reservoir and above the seal, and surface releases
Safe Operations	Well maintenance, conduct of operations, well-field monitoring and controls
Storage Engineering	Number and location of injection wells, strategies to maximize capacity and accelerate trapping, and well completion design
Site Characterization and Selection	Site specific assessment of storage capacity, seal integrity, injectivity and brine migration
Fundamental Storage and Leakage Mechanisms	Multi-phase flow, trapping mechanisms, geochemical interactions, geomechanics, and basin-scale hydrology

Are We Ready?

State-of-the-art is well developed, scientific understanding is excellent and engineering methods are mature

Sufficient knowledge is available but practical experience is lacking, economics may be sub-optimal, scientific understanding is good

Demonstration projects are needed to advance the state-of-the art for commercial scale projects, scientific understanding is limited

Pilot projects are needed to provide proof-of-concept, scientific understanding is immature

New ideas and approaches are needed

Status of Geological Storage

	Oil and Gas	Saline Aquifers	Coalbeds
Financial Responsibility

Safe Operations			
Storage Engineering			
Site Characterization and Selection			
Fundamental Storage and Leakage Mechanisms			

Maturity Summary

- Are we ready for CCS?

Oil and gas reservoirs

Saline aquifers

Coalbeds

State-of-the-art is well developed, scientific understanding is excellent and engineering methods are mature

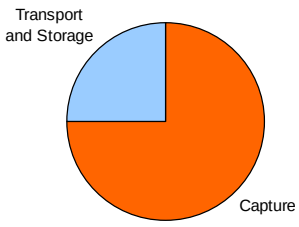
Sufficient knowledge is available but practical experience is lacking, economics may be sub-optimal, scientific understanding is good

Demonstration projects are needed to advance the state-of-the art for commercial scale projects, scientific understanding is limited

Pilot projects are needed to provide proof-of-concept, scientific understanding is immature

Conclusions

- CCS is an important part of the portfolio of technologies for reducing greenhouse gas emissions
- Progress on CCS proceeding on all fronts
  - Industrial-scale projects
  - Demonstration plants
  - R&D
- Technology is sufficiently mature for large scale demonstration projects
- Research is needed to support deployment at scale
  - Capture: Reduce costs and improve reliability
  - Storage: Improve storage security and avoid unintentional environmental impacts
- Institutional issues need to be resolved to support widespread deployment



Costs of CCS
